

Silver City Optimizes On-site 24-Hour Surveillance with Acquired Gentlemen Private Protection

A metropolitan multifamily residential property faced with on-site trespassing incidents from urban campers achieved the optimal protection they desired thanks to an A.G.P.P Integrated Guarding Plan.

The Challenge

The residential site located in the Greater-Houston Area had a history of urban campers trespassing during night hours. These incidents occurred frequently making it challenging for local police to respond promptly. The site's proximity to an active expressway further complicated the situation as it was hard to differentiate between regular on-site movements and suspicious activities.

The Solution

ONSITE GUARDING

On-site Guarding was used to protect the residential community of Yellowstone from incidents that often happened during night hours. The On-site Officers provided immediate protection and response to any on-scene incidents that required quick action.

REMOTE GUARDING

A.G.P.P identified the site's most vulnerable areas and then designed a small video surveillance system. This system was created to easily deploy security cameras that were enhanced with Remote Perimeter Protection video analytic capabilities.

The Result

The new security measures have successfully prevented unwanted visitors from entering the premises. The decrease in trespassing incidents demonstrates the effectiveness of these measures in safeguarding the property. By implementing these security measures, the property has become a safer environment for residents. This proactive approach to security has created a sense of peace and security within the community.
